Assignment 2
Due on Feb 25, 2020

One researcher found one organism has a very interesting property. After many steps' purification, he was able to get a small amount of protein. Then he used Mass spectrometry *(*MS*)* to find out the sequence and the molecular weight of the protein. The protein sequence is provided in the form of single-letter amino acid code.

He needs to make more protein to further characterize it. Unfortunately, he does not have enough organisms to provide him enough protein for the characterization.

You need to help him by doing the following things:

(a) Propose a method to make more protein (as detailed as possible)
(b) Tell him the molecular weight of this protein
(c) Convert the protein sequence to corresponding DNA sequence (Please specific which codon you are using)
(d) What is the putative function of this protein? (using protein blast tools in one of the provided bioinformatics databases)
(e) Give at least three applications of this protein
